SDK 2.10 hardware porting is systematic, not mysterious

The first WSE-3 runs revealed three concrete compatibility classes.

Class	Required fix	Examples
Simple 4 kernels	remove comptime_struct annotations	Histogram, DFT, Stencil7pt, GEMV-RowPart
Medium 5 kernels	add default layout params	Tensor, GEMM, Histogram-Inline, PDFT, Matvec
Hard 5 kernels	rewrite memcpy/struct wiring	Wide-Mult, Mandelbrot, Jacobi, Residual, multi-PE concat

Takeaway: hardware execution is now available. The blocker moved from 'can we run?' to 'can we automate SDK-version porting?'
