SpGEMM on the WSE-3 SDK simulator: local work, memory and communication
21/28 configurations passed · Sweep still running
Full-row SpGEMM: fixed-matrix scaling
Root interval (simulator cycles)
Application PEs
16 × 16
64 × 64
Speedup includes communication
Speedup over matching one-PE run
Linear reference
Weak scaling: four output rows per PE
Simulator cycles
B broadcast + compute + completion
Start token + compute + completion
Slowest local compute
Balancing clustered long rows
Equal-row / balanced root time
Cost of bounded accumulator storage
Bounded / full-row root time
Density control: 64 × 64 matrices
3 entries per input row
8 entries per input row
